

Problem of the Week

Problem E

Marvel at This

With the renewed interest in movies based on comic book characters, many clubs for comic book collectors have started. One such club attracts between 15 and 35 members to their monthly meetings.

At their last meeting, they discovered that all of the members in attendance had exactly the same number of comic books, except for one member who had one more comic book than each of the other members. Between them, the members had precisely 1 000 comic books.

How many members attended the last meeting?
