# Grade 7/8 Math Circles <br> February 19th, 2024 <br> Graph Theory: Isomorphisms - Problem Set 

For the first four questions consider the graph $G$ below:

1. For the graph $G$ answer the following questions:
(a) What is $V(G)$ ?
(b) What is $E(G)$ ?
(c) What are the neighbours and degree of each vertex in $G$ ?

Solution:
(a) $V(G)=\{1,2,3,4,5,6,7, a, b, c, d, e, f\}$
(b) $E(G)=\{\{1,3\},\{1,4\},\{2, a\},\{2, d\},\{3, e\},\{4,6\},\{4, c\},\{4, e\},\{5,6\},\{5, e\}$, $\{6, e\},\{7, d\},\{a, f\},\{b, f\},\{d, f\}\}$
(c)

| Vertex | Neighbours of Vertex | Degree of Vertex |
| :---: | :---: | :---: |
| 1 | 3 and 4 | 2 |
| 2 | $a$ and $d$ | 2 |
| 3 | 1 and $e$ | 2 |
| 4 | $1,6, c$ and $e$ | 4 |
| 5 | 6 and $e$ | 2 |
| 6 | 4,5 and $e$ | 3 |
| 7 | $d$ | 1 |
| $a$ | 2 and $f$ | 2 |
| $b$ | $f$ | 1 |
| $c$ | 4 | 1 |
| $d$ | 2,7 and $f$ | 3 |
| $e$ | $3,4,5$ and 6 | 4 |
| $f$ | $a, b$ and $d$ | 3 |

2. Is $G$ isomorphic to the graph $H$ below? If yes provide an isomorphism if not explain why.

Solution: No, $G$ is not isomorphic to $H$ because $G$ has 13 vertices while $H$ only has 11 vertices, thus for any function $f: V(G) \Rightarrow V(H)$ that we build, $f$ will not satisfy Criterion \#2 of Graph Isomorphisms, since more than one vertex in $G$ will have to be mapped to the same vertex in $Q$.
3. Is $G$ isomorphic to the graph $Q$ below? If yes provide an isomorphism if not explain why.

Solution: No, $G$ is not isomorphic to $Q$ because $G$ has 3 vertices of degree 1, while $Q$ only has 1 , thus for any function $f: V(G) \Rightarrow V(H)$ that we build, $f$ will not satisfy Criterion \#1 of Graph Isomorphisms.
4. Is $G$ isomorphic to the graph $P$ below? If yes provide an isomorphism if not explain why.

Solution: No, $G$ is not isomorphic to $Q$. Notice that in $Q$ the vertex 8 has degree 5, but no vertex in $G$ has degree greater than 4, thus for any function $f: V(G) \Rightarrow V(H)$ that we build, $f$ will not satisfy Criterion \#1 of Graph Isomorphisms.

For the next 4 Questions consider the isomorphic graphs $G$ and $Q$ below :

5. Is $f: V(G) \rightarrow V(Q)$ an isomorphism, where $f$ is the following map? If it is an isomorphism then prove it, if not then explain why: | $v$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f(v)$ | $a$ | $b$ | $c$ | $d$ | $e$ | $f$ | $g$ | $h$ | $i$ | $j$ |

Solution: To check that $f$ is an isomorphism it suffices to show that $f$ fulfills Criteria 1,2 and 3 from the lesson. We'll first check that if $u$ and $v$ are adjacent vertices in $G$, then $f(u)$ and $f(v)$ are adjacent in $Q$. We'll do this by listing out the neighbours for each vertex $u$ in $G$ and seeing if they match up with the neighbours of $f(u)$ in $Q$ :

| $u$ | $f(u)$ | neighbours of $u$ |
| :--- | :--- | :--- |
| relabelled neighbours of $u$ | neighbours of $f(u)$ |  |

| 1 | $a$ | 2 | $b$ | $h$ |
| :---: | :---: | :---: | :---: | :---: |

We can stop here since we've already found a problem with $f$. we know that $f(1)=a$, but from our chart above we see that the vertex 1 in $G$ is a vertex of degree 2 in $G$ with neighbours 3 and 4 but the vertex $a$ in $Q$ is a vertex of degree 1 with neighbour $h$, since the degrees and neighbours of 1 and $a$ do not match up then we have that $f$ has not satisfied Criterion \#1 of Graph Isomorphisms, and so $f$ is not an isomorphism.
6. Is $f: V(G) \rightarrow V(Q)$ an isomorphism, where $f$ is the following map? If it is an isomorphism then prove it, if not then explain why:

| $v$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f(v)$ | $a$ | $b$ | $c$ | $d$ | $e$ | $a$ | $g$ | $h$ | $i$ | $j$ |

Solution: To check that $f$ is an isomorphism it suffices to show that $f$ fulfills Criteria 1,2 and 3 from the lesson. Since $f(1)=a$ we know from part a that this already makes $f$ fail Criterion \#1 of Graph Isomorphisms. But we can also notice something crucial by
looking at our input-output chart! In the outputs we can see that $f(1)=a$ and $f(6)=a$ but we know that vertex $1 \neq$ vertex 6 , thus $f$ fails Criterion $\# 2$ of Graph Isomorphisms as well, and so $f$ is not an isomorphism. But there is one last thing we could've noticed by looking at our input-output chart, in the outputs we can see that the vertex $f$ does not show up and so $f$ fails Criterion $\# 3$ of Graph Isomorphisms as well. Thus clearly since $f$ fails all of Criteria 1, 2 and 3 from the lesson then $f$ is not an isomorphism.
7. Is $f: V(G) \rightarrow V(Q)$ an isomorphism, where $f$ is the following map? If it is an isomorphism then prove it, if not then explain why:

| $v$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f(v)$ | $a$ | $h$ | $i$ | $d$ | $c$ | $b$ | $j$ | $f$ | $g$ | $e$ |

Solution: To check that $f$ is an isomorphism it suffices to show that $f$ fulfills Criteria 1, 2 and 3 from the lesson. We'll first check that if $u$ and $v$ are adjacent vertices in $G$, then $f(u)$ and $f(v)$ are adjacent in $Q$. We'll do this by listing out the neighbours for each vertex $u$ in $G$ and seeing if they match up with the neighbours of $f(u)$ in $Q$ :

| $u$ | $f(u)$ | neighbours of $u$ | relabelled neighbours of $u$ | neighbours of $f(u)$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $a$ | 2 | $h$ | $h$ |
| 2 | $h$ | 6,8 and 9 | $b, f$, and $g$ | $b, f$, and $g$ |
| 3 | $i$ | 6,7 and 8 | $\mathrm{~b}, j$ and $f$ | $\mathrm{~b}, j$ and $f$ |
| 4 | $d$ | 5,6 and 8 | $c, b$ and $f$ | $c, b$ and $f$ |
| 5 | $c$ | 4 | $d$ | $d$ |
| 6 | $b$ | 2,3 and 4 | $h, i$ and $d$ | $h, i$ and $d$ |
| 7 | $j$ | 3,9 and 10 | $i, g$ and $e$ | $i, g$ and $e$ |
| 8 | $f$ | 2,3 and 4 | $h, i$ and $d$ | $h, i$ and $d$ |
| 9 | $g$ | 2 and 7 | $h$ and $j$ | $h$ and $j$ |
| 10 | $e$ | 4 and 7 | $d$ and $j$ | $d$ and $j$ |

Now notice the last two columns of the chart above show that if $u$ and $v$ are adjacent vertices in $G$, then $f(u)$ and $f(v)$ are adjacent in $Q$ since they match up exactly. Thus $f: V(G) \rightarrow V(Q)$ fulfills Criterion \#1 of Graph Isomorphisms. Now looking at our inputoutput table we can see that each vertex in $Q$ appears exactly once- this immediately tells us that $f: V(G) \rightarrow V(Q)$ fulfills Criterion $\# 2$ and \#3 of Graph Isomorphisms! Therefore
$f$ fulfills Criteria 1, 2 and 3 from the lesson and so $f$ is an isomorphism.

8. Is $f: V(G) \rightarrow V(Q)$ an isomorphism, where $f$ is the following map? If it is an isomorphism then prove it, if not then explain why: | $v$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $f(v)$ | $b$ | $a$ | $f$ | $i$ | $c$ |  |  |  |  |

Solution: To check that $f$ is an isomorphism it suffices to show that $f$ fulfills Criteria 1,2 and 3 from the lesson. We'll first check that if $u$ and $v$ are adjacent vertices in $G$, then $f(u)$ and $f(v)$ are adjacent in $Q$. We'll do this by listing out the neighbours for each vertex $u$ in $G$ and seeing if they match up with the neighbours of $f(u)$ in $Q$ :

| $u$ | $f(u)$ | neighbours of $u$ | relabelled neighbours of $u$ | neighbours of $f(u)$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $b$ | 2 | $a$ | $h$ |

We can stop here since we've already found a problem with $f$. we know that $f(1)=b$ and since 2 is the neighbour of 1 in $G$ we need $f(2)=a$ to be a neighbour to $f(1)=b$ in Q , but we know that $a$ and $b$ are not neighbours in $Q$ and so $f$ fail Criterion \#1 of Graph Isomorphisms, telling us that $f$ is not an isomorphism.
9. Are the following two graphs $G$ and $Q$ isomorphic? If yes provide an isomorphism, if not then state why.

Solution: Yes, the graphs $G$ and $Q$ are isomorphic! Consider the isomorphism $f: V(G) \rightarrow V(Q)$ given in the following input-output table;

| $u$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f(u)$ | $e$ | $a$ | $c$ | $b$ | $g$ | $d$ | $f$ |

10.     * The following two graphs $G$ and $Q$ not isomorphic. With one change (adding/removing on edge or one vertex) how could you make these two graphs isomorphic? Prove that after the change the graphs are isomorphic.
$G$

Solution: The change is to add an edge between vertices 1 and 3 in $G$. Then the function $f: V(G) \rightarrow V(Q)$ is an isomorphism, where $f$ is given by: the following input-output table;

| $u$ | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $f(u)$ | $e$ | $a$ | $b$ | $d$ | $c$ |

11.     * The following two graphs $G$ and $Q$ not isomorphic. With one change (adding/removing on edge or one vertex) how could you make these two graphs isomorphic? Prove that after the change the graphs are isomorphic.

Solution: The change is to remove vertex 7 from $G$. Then the function $f: V(G) \rightarrow V(Q)$ is an isomorphism, where $f$ is given by: the following input-output table;

| $u$ | 1 | 2 | 3 | 4 | 5 | 6 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f(u)$ | $a$ | $e$ | $g$ | $c$ | $f$ | $d$ | $b$ |

12. ${ }^{* * *}$ Below are the graphs $P_{2}, P_{3}$, and $P_{4}$ from the family of Polygon Graphs, the polygon graph $P_{n}$ is simply the regular polygon with $n$ sides ( $P_{3}$ is a triangle, $P_{4}$ is a rectangle, $P_{5}$ is a pentagon etc):

(a) Draw and label the graphs $P_{5}, P_{6}$, and $P_{7}$.
(b) We define the complement of a graph G as $\bar{G}$ to be a graph with the same vertex set as G, but has an edge set in which any edge that is not in G is an edge of $\bar{G}$. Below are the graphs of $\bar{P}_{2}, \bar{P}_{3}$, and $\bar{P}_{4}$. Draw and label the graphs of $\bar{P}_{5}, \bar{P}_{6}$, and $\bar{P}_{7}$.

(c) Which of $P_{2}, P_{3}, P_{4}, P_{5}, P_{6}$, and $P_{7}$ are isomorphic to their complement, state which one(s) are isomorphic and provide and isomorphism.
(d) Besides the isomorphic graph (s) you found in part c is there any other graph in the Polygon Graph family which will be isomorphic to its complement? Explain your reasoning.

## Solution:

(a)

(c) Only $P_{5}$ is isomorphic to its complement- the isomorphism is as follows:

| $u$ | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $f(u)$ | 1 | 3 | 5 | 2 | 4 |

(d) Only $P_{5}$ is isomorphic to its complement, notice that in each graph $P_{n}$ all vertices have degree equal to 2 , so for $P_{n}$ to be isomorphic to its complement we require that
all vertices in $\bar{P}_{n}$ also have degree equal to 2 . If all vertices in $\bar{P}_{n}$ have degree equal to 2 then this means that for a given vertex $u$ in $P_{n}, u$ is not adjacent to exactly two vertices, and we also know that all vertices in $P_{n}$ have degree equal to 2 so in $P_{n}$ there are two vertices adjacent to $u$, two vertices not adjacent to $u$ and $u$ its self, this tells us that $P_{n}$ has exactly 5 vertices. Therefore only $P_{5}$ is isomorphic to its complement.
