The Centre for Education in Mathematics and Computing is pleased to announce the results of the 2015 Canadian Senior and Intermediate Mathematics Contests.

Our congratulations go to all who participated in this year's CSMC and CIMC. This year's Contests were resounding successes, with averages of 30.8 and 33.9, respectively.

As always, we would like to thank the hard-working Problems Committees. Many of the members of these Committees are active secondary school teachers who volunteer their time and contribute dozens of hours of expertise. Without their intriguing and sometimes amusing problems, these Contests would not be possible.

We would also like to thank all participants, both teachers and students. We hope that the papers provided you with some interesting mathematics to think about and play with. Thank you for your support! Please continue to encourage your colleagues and fellow students to become involved in our activities.

Le Centre d'éducation en mathématiques et en informatique à d'annoncer les résultats du Conours canadiens de mathématiques de niveau supérieur et intermédiaire 2015.

Nos félicitations vont à tous les participants du CCMS et du CCMI de cette année. Les Concours de cette année retentissaient de succès, avec des moyennes de 30,8 et 33,9, respectivement.

Nous aimerions surtout remercier les Comités de problèmes pour leur dur travail. Plusieurs membres de ces Comités sont des enseignant(e)s d'école secondaire actifs qui offre leur temps et contribuent des douzaines d'heures d'expertise. Sans leurs problèmes perspicaces et amusants, ces Concours ne seraient pas possibles.

Nous aimerions remercier aussi tous les participants incluant les enseignants et les étudiants. Nous espérons que les concours vous ont offert des mathématiques intéressantes qui vous ont amusées et portées à réfléchir. Merci pour votre soutien continué!

Comments on the Contests

CANADIAN SENIOR MATHEMATICS CONTEST
Part A

1. Very well done.
   Average: 4.8

2. Very well done. Common errors were allowing non-integer values for the digits (either through arithmetic errors or not considering "carried" digits), forgetting to report the value of $A + B + C$, or reporting the sum $8 + 7 + 6$.
   Average: 4.4

3. Students generally knew what to do with this problem but many errors were made in the actual calculations, including mistakes with unit conversions, formula usage and rounding.
   Average: 3.6

4. Problems involving exponent laws often present difficulties. This problem was no exception, as many students misused known laws.
   Average: 3.2

5. There were three common errors for this problem. The first solution attempt took the ratio of 0.95 : 0.9 which is incorrect. As an analogy, just because a student gets 95% on an exam does not mean the student obtained 95 marks on the exam. The second common error involved the answer 21 : 19. To obtain this incorrect answer, students assumed (in some form) that Anna was shown 100 pictures of dogs and 100 pictures of cats. Then students assumed that of the 100 dog pictures, Anna guessed dogs 95 times and cats 5 times and similarly, for the 100 cat pictures, they assumed that Anna guessed cat 90 times and dog 10 times. They argued that this implied that Anna guessed dog 95% of the times she was shown a dog photo (and similarly for cat photos). However, the error here is that the problem does not say "Anna is correct 95% of the time she is shown a dog". The problem states "Anna is correct 95% of the time when she *guesses* dog". In the above computation, Anna is correct $95/(95 + 10) < 0.95$ when she guesses dog. The correct answer should indicate that if d is the number of times she guesses dog, then she is shown $0.95d$ dogs and $0.05d$ cats (and similarly with dogs and cats replaced) and proceed to find the ratio $d : c$. Lastly, many students incorrectly stated the ratio in the inverted order.
   Average: 1.4

6. Some students were able to come up with the expression $1 = \dfrac{n + am}{mn - a}$ but from here, many isolated for a which typically ended in a dead end. Students who were able to find the expression $2a = (m-1)(n-a)$ were often able to solve the problem with a few isolated counting errors.
   Average: 0.6

Part B

1. This question was well done. There were many different approaches used in parts (c) and (d). One frequent error in part (d) resulted from students using information from part (c) that did not apply in (d).
   Average: 8.1

2. Part (a) was quite well done. The most common error was identifying $r = 0$ and/or $r = 2$ as solutions without justifying why these were the only solutions. In part (b), many students made the logical error of assuming that $f(f(x)) = x$ and deriving a true statement rather than deriving that $f(f(x)) = x$. Some solutions were more complicated than necessary. Parts (c) and (d) were more involved. In part (c), some students did not justify eliminating the solution "$k = 2 - x$" because it depends on x, or cancelled out x from both sides of an equation without considering what happens in the case $x = 0$. Some solutions to part (d) involved a great deal of algebra without reaching a quadratic in x.
   Average: 3.6

3. Part (a) of this problem was well done by those who attempted it, the most common error being an arithmetic mistake. For part (b), those that attempted the problem were often able to see the pattern that emerged but few were able to give a formal and convincing argument that there were no other solutions. Part (c) was an extremely challenging problem that lies in the field of Arithmetical Dynamics. Few students made progress on this question. Many who attempted the problem saw that the b_n terms were bounded but few were able to give a formal proof.

    Average: 1.1

Comments on the Contests

CANADIAN INTERMEDIATE MATHEMATICS CONTEST
Part A

1. Very well done. Some students did not answer the question completely and some students made a mechanical error.
   Average: 4.4

2. Very well done. Some arithmetic errors were made. Some students confused the height and the hypotenuse in the right-angled triangles.
   Average: 4.6

3. Very well done. Most incorrect solutions came from applying incorrect geometry rules or making small arithmetic errors.
   Average: 4.3

4. Well done. Most of the mistakes that were made were algebraic. Some students incorrectly turned the second expression into an equation.
   Average: 3.2

5. This problem was challenging. Not many students attempted to find prime factorizations. Many students gave the answer $n = 2$, which makes the given expression a perfect cube, but is the smallest positive integer n for which this is true, not the largest positive integer $n < 500$.
   Average: 1.1

6. This problem was quite challenging. Some students were able to count the number of triples (a, b, c) for one or two values of a or c. From here, only a few students were able to find correct patterns and thus to compute the total number of triples (a, b, c).
   Average: 0.6

Part B

1. This problem was fairly well done. If students understood how to handle the overlap of the two groups of students, they did quite well on all three parts. We saw a lot of nice solutions using Venn Diagrams. In part (c), some students were able to set up an expression for the total number of students using two variables, but were unable to relate the two groups and get an expression with one variable.
   Average: 6.9

2. Part (a) was well done. Students who did not earn full marks usually used $\frac{1}{3}$ instead of $\frac{1}{13}$ when calculating the number of kilometres. Parts (b) and (c) were usually done correctly or not at all. The marking team was impressed by the variety of correct solutions presented in (c).
   Average: 6.2

3. Part (a) was done well, although some students used the Pythagorean Theorem "backwards". There were many different methods that led to a correct answer in part (b), though in many cases we would have liked to have seen more explanation. In part (c), many students wrote down a condition equivalent to $b = a + 1$, but made no further progress. A number of solutions consisted of long lists of triples that students were testing to see if they satisfied the given conditions. This problem is an excellent example of one where systematic algebraic and logical work yields the solution eventually.
   Average: 2.6

CONCOURS CANADIEN DE MATHÉMATIQUES DE NIVEAU SUPÉRIEUR
Partie A

1. Ce problème a été très bien réussi.
   Moyenne: 4,8

2. Ce problème a été très bien réussi. Parmi les solutions incorrectes, on a remarqué des valeurs non entières pour les chiffres (à cause d'erreurs de calcul ou de l'oubli des « retenues »), l'oubli de donner la valeur de $A + B + C$ ou la valeur de $8 + 7 + 6$ comme réponse.
   Moyenne: 4,4

3. De façon générale, les élèves savaient comment s'y prendre pour résoudre ce problème, mais ils ont commis un bon nombre d'erreurs, par exemple des erreurs de calcul, de conversion d'unités et d'arrondissement, ainsi que des erreurs dans l'utilisation d'une formule.
   Moyenne: 3,6

4. Les problèmes portant sur les lois des exposants présentent habituellement des difficultés aux élèves. Ce problème n'a pas fait exception. De nombreux élèves ont mal utilisé ces lois.
   Moyenne: 3,2

5. On a noté trois erreurs communes. La première erreur utilisait le rapport $0,95 : 0,9$ qui est erroné. En effet, si un élève obtient une note de $95\,\%$ à l'examen, cela ne veut pas dire qu'il a obtenu 95 points. La deuxième erreur donnait pour réponse $21 : 19$. Pour obtenir cette réponse erronée, les élèves supposaient directement ou indirectement qu'on avait présenté 100 images de chiens et 100 images de chats à Anna. Les élèves supposaient ensuite que dans le cas des 100 images de chiens, Anna avait répondu *chien* 95 fois et *chat* 5 fois et que dans le cas des 100 images de chats, elle avait répondu *chat* 90 fois et *chien* 10 fois. Ils prétendaient ensuite qu'Anna avait répondu *chien* $95\,\%$ des fois qu'on lui avait présenté une image d'un chien et qu'elle avait répondu *chat* $90\,\%$ des fois qu'on lui avait présenté une image d'un chat. Mais l'énoncé ne dit pas que « Anna a répondu correctement $95\,\%$ du temps lorsqu'on lui a présenté l'image d'un chien » . L'énoncé dit plutôt que « Anna a répondu correctement $95\,\%$ du temps lorsqu'elle a *répondu chien* ». Dans ce calcul, Anna répond $95/(95 + 10)$ du temps lorsqu'elle répond *chien*, ce qui est inférieur à $0,95$. La bonne réponse devrait indiquer que si Anna répond *chien* n fois, alors on lui a présenté $0,95n$ images de chiens et $0,05n$ images de chats et que si elle répond *chat* t fois, alors on lui a présenté $0,9t$ images de chats et $0,1t$ images de chiens pour ensuite déterminer le rapport $n : t$. La troisième erreur présentait le rapport inverse comme réponse.
   Moyenne: 1,4

6. Certains élèves ont réussi à obtenir l'équation $\dfrac{n + am}{mn - a} = 1$. Beaucoup d'entre eux ont ensuite tenté d'isoler a, ce qui ne menait à rien. La plupart de ceux qui ont réussi à obtenir l'équation $2a = (m - 1)(n - a)$ ont aussi réussi à résoudre le problème.
   Moyenne: 0,6

Partie B

1. Ce problème a été bien réussi. Les élèves ont utilisé une bonne variété d'approches dans les parties (c) et (d). Dans la partie (d), certains élèves ont utilisé un résultat de la partie (c) qui ne s'appliquait pas dans la partie (d).
   Moyenne: 8,1

2. La partie (a) a été bien réussie. L'erreur la plus commune était d'affirmer que $r = 0$ et/ou $r = 2$ sans justifier que c'étaient les seules solutions. Dans la partie (b), bon nombre d'élèves ont commis une erreur de logique en tentant de prouver la proposition réciproque, c'est-à-dire en supposant que $f(f(x)) = x$ pour démontrer un énoncé vrai au lieu de partir de la définition pour démontrer que $f(f(x)) = x$. Certaines solutions étaient

plus complexes qu'il ne fallait. Les parties (c) et (d) étaient plus exigeantes. Dans la partie (c), certains élèves n'ont pas justifié leur choix d'éliminer la solution « $k = 2 - x$ » en affirmant qu'elle dépend de x. D'autres ont annulé x des deux membres de l'équation sans considérer le cas où $x = 0$. Dans la partie (d), certains ont fait beaucoup d'algèbre sans aboutir à une équation du second degré en x.
Moyenne: 3,6

3. La partie (a) a été bien réussie par ceux qui ont tenté de résoudre le problème. Dans la partie (b), ceux qui ont tenté de résoudre le problème ont souvent réussi à percevoir la régularité, mais peu d'entre eux ont réussi à présenter un argument solide pour démontrer qu'il n'y avait aucune autre valeur de n. La partie (c) présentait un problème complexe du domaine de la dynamique arithmétique. Peu d'élèves ont réussi à progresser. Bon nombre d'élèves ont compris que les termes b_n étaient bornés, mais peu d'entre eux ont réussi à le prouver.
Moyenne: 1,1

CONCOURS CANADIEN DE MATHÉMATIQUES DE NIVEAU INTERMÉDIAIRE
Partie A

1. Ce problème a été très bien réussi. Certains élèves n'ont pas complètement répondu à la question et quelques autres ont commis des erreurs de calcul.
Moyenne: 4,4

2. Ce problème a été très bien réussi. Certains élèves ont commis des erreurs de calcul. Certains élèves ont pris l'hypoténuse pour la hauteur dans les triangles rectangles.
Moyenne: 4,6

3. Ce problème a été très bien réussi. La plupart des erreurs provenaient d'erreurs de calcul ou d'une méconnaissance des relations entre les angles.
Moyenne: 4,3

4. Ce problème a été bien réussi. La plupart des erreurs étaient de nature algébrique. Certains élèves ont transformé l'expression donnée en équation, ce qui incorrect.
Moyenne: 3,2

5. Ce problème présentait un défi. Peu d'élèves ont fait appel à la factorisation première. Beaucoup ont répondu $n = 2$, qui donne un cube parfait, mais il s'agit de la plus petite valeur entière de n pour laquelle l'expression est un cube parfait et non pas la plus grande dans l'intervalle $n < 500$.
Moyenne: 1,1

6. Ce problème présentait tout un défi. Certains élèves ont réussi à compter les triplets (a, b, c) pour une ou deux valeurs de a ou de c. De là, seulement quelques élèves ont réussi à voir les régularités et déterminer le nombre total de triplets (a, b, c).
Moyenne: 0,6

Partie B

1. Ce problème a été assez bien réussi. Les élèves qui ont compris comment traiter le nombre d'élèves qui faisaient partie des deux classes ont généralement réussi les trois parties du problème. Certaines solutions élégantes faisaient appel à des diagrammes de Venn. Dans la partie (c), certains élèves ont formé une expression à deux variables pour le nombre total d'élèves, mais sans réussir à établir un lien entre les deux groupes de manière à obtenir une expression à une variable.
Moyenne: 6,9

2. La partie (a) a été bien réussie. L'erreur la plus commune a été d'utiliser la fraction $\frac{1}{3}$ au lieu de $\frac{1}{13}$ pour calculer le nombre de kilomètres. Les parties (b) et (c) ont été ou bien réussies ou bien ignorées. L'équipe de notation a été impressionnée par la variété de solutions dans la partie (c).
Moyenne: 6,2

3. La partie (a) a été bien réussie, même si certains ont utilisé le théorème de Pythagore. Plusieurs méthodes ont été utilisées avec succès dans la partie (b), mais dans de nombreux cas, on aurait préféré plus d'explications et de justification. Dans la partie (c), certains ont écrit une condition équivalente à $b = a+1$, mais sans l'utiliser. Dans certaines présentations, les élèves ont écrit une longue liste de triplets qu'ils ont utilisés pour vérifier s'ils satisfaisaient aux conditions données. Ce problème est un bon exemple qui démontre que l'utilisation coordonnée de l'algèbre, accompagnée d'une bonne pensée logique, mène éventuellement à une solution.
Moyenne: 2,6
