The Centre for Education in Mathematics and Computing is pleased to announce the results of the 2017 Canadian Senior and Intermediate Mathematics Contests.

Our congratulations go to all who participated in this year's CSMC and CIMC. This year's Contests were resounding successes, with averages of 33.5 and 34.8, respectively.

As always, we would like to thank the hard-working Problems Committees. Many of the members of these Committees are active secondary school teachers who volunteer their time and contribute dozens of hours of expertise. Without their intriguing and sometimes amusing problems, these Contests would not be possible.

We would also like to thank all participants, both teachers and students. We hope that the papers provided you with some interesting mathematics to think about and play with. Thank you for your support! Please continue to encourage your colleagues and fellow students to become involved in our activities.

Le Centre d'éducation en mathématiques et en informatique a d'annoncer les résultats du Concours canadiens de mathématiques de niveau supérieur et intermédiaire 2016.

Nos félicitations vont à tous les participants du CCMS et du CCMI de cette année. Les Concours de cette année retentissaient de succès, avec des moyennes de 33,5 et 34,8, respectivement.

Nous aimerions surtout remercier les Comités de problèmes pour leur dur travail. Plusieurs membres de ces Comités sont des enseignant(e)s d'école secondaire actifs qui offre leur temps et contribuent des douzaines d'heures d'expertise. Sans leurs problèmes perspicaces et amusants, ces Concours ne seraient pas possibles.

Nous aimerions remercier aussi tous les participants incluant les enseignants et les étudiants. Nous espérons que les concours vous ont offert des mathématiques intéressantes qui vous ont amusées et portées à réfléchir. Merci pour votre soutien continué!

CANADIAN SENIOR MATHEMATICS CONTEST

Part A

1. Very well done. There were few trends among incorrect solutions. The only common error was transcribing the expression incorrectly.
Average: 4.9
2. Very well done. Common mistakes were interpreting 30% as $\frac{1}{3}$ and incorrectly calculating the area of a triangle. Most students followed the approach in Solution 1.
Average: 4.7
3. Quite well done. Common errors included finding only $x = 0$ or only $x = 3$ by trial and error, or missing $x = 0$ by “cancelling it out”, e.g. $x(x^3 - 3x^2 + x - 3) = 0$ so $x^3 - 3x^2 + x - 3 = 0$.
Average: 4.2
4. In this question, there were many common incorrect answers, including 18, 24, 72, 96. Part marks were awarded when students demonstrated principles of counting but overcounted or undercounted. Partial marks were also awarded when students attempted to list all possibilities and the list had slightly over or under 36 items.
Average: 3.1
5. Students discovered lots of interesting patterns and found many different ways to continue or generalize the patterns. Very often this led to either the correct answer of 10944 or somewhere close to the correct final answer. If you attempted the problem by exhaustively adding all the numbers along the line $y = -x$, then we recommend you read the solutions to see how to compute this algebraically, which has the advantage of not being too much more difficult if the number 1000 was increased to a much larger number.
Average: 1.7
6. This question was very difficult. It required the combination of both Euclidean and analytic geometry following the “correct” construction of joining the centre of the larger circle to the three points of tangency between the semicircles and larger circle.
Average: 0.2

Part B

1. This question was very well done. In part (b), a common error was not (or incorrectly) solving for b and c from the two equations. In part (c), common errors included not setting y to 0 in $y = -\frac{2}{3}(d - 1)^2 + \frac{8}{3}$, and failing to restrict d to a positive value.
Average: 8.6
2. Students who attempted this problem generally got both part (a) and part (b). In part (b), most students gave a 3-turn solution. Part (c) was often not attempted. Of those who attempted, there were many students who recognized that you cannot win when k is even. Their argument for this fact had good ideas but usually lacked rigour. Fewer students went on to argue that you can win when k is odd. It was very rare to find a clear algorithm which showed that this was possible.
Average: 4.4
3. We were very happy to see a considerable number of correct solutions to part (a) which required understanding the composition of functions. A significant number of solutions to part (b) exhibited enough persistence to correctly deduce that no such function exists. As expected, part (c) was very difficult. Credit was given for noticing that the function $h(k) = k + 1$ satisfies the given properties. Inspection of our solutions will illustrate how challenging it was to completely solve the problem by proving that no other function satisfies the properties.
Average: 1.7

CANADIAN INTERMEDIATE MATHEMATICS CONTEST

Part A

1. This question was well done. There were some common mistakes pertaining to the equal angles in the triangle.
Average: 4.7
2. Most students were able to generate an ordered list with at least 7 of the 12 numbers. Some students were unable to select the correct two numbers required for the sum.
Average: 3.9
3. Very well done. Errors were largely computational and not conceptual.
Average: 4.8
4. Fairly well done. The most frequent errors were using the incorrect area formula, not being sufficiently careful when approximating π , and not using the area of the chocolate chip.
Average: 3.9
5. Fairly well done. Many forgot that the question told them that a , b and c were positive integers and provided $b = 1$ (taking the smallest positive integer for b) or $b = \frac{31}{8}$ (by substituting $a = 0$ and $c = 0$) as their answer. Students who struggled with this question often used trial and error and didn't think to clear the denominators as a first step.
Average: 2.6
6. Students really struggled with where to start on this question. In particular, a good portion of students didn't consider to use the indirect method. Many students attempted this problem by drawing lots of examples. Part marks with these attempts were only given if students showed some effort to organize the examples into cases.
Average: 0.4

Part B

1. Very well done. A common error was using perimeter in part (a) where the number of squares was needed. In part (d), the most common error was not converting from the perimeter to the figure number.
Average: 8.2
2. The factorial definition was applied generally well in part (a). In part (b), the question asked the students to generate a factorial from a given factorial. We had expected more success than we actually observed. For part (c), many came up with a quadratic and did not eliminate the inadmissible root (-202). In the final part, many used specific examples to show that r was a perfect square. This was not sufficient to generalize.
Average: 5.0
3. In part (a), lots of students were able to list all the positive integers of the form $3b8d5f$. However, full marks were only given to students who were able to provide justification. In particular, for full marks students needed to provide justification why b must equal 5 and nothing else. In part (b), many students who realized b must equal c and then gave 499 as a three-digit positive integer with exactly three balanced positive integers of the form $4bcdef$. In fact, there are 6 balanced integers of the form $499def$ as def could also be an arrangement of 669. Some students argued that due to 5 and 7 being prime 455 and 477 were the *only* three-digit positive integers and didn't realize 488 was another possibility. Since the question only asked for one such number no marks were deducted for saying that 455 and 477 were the only three-digit positive integers. Most of the students who attempted part (c) were able to get part marks for this question. Where students struggled was providing justification on why $k = 4, 5, 8$ were not possible.
Average: 1.3

CONCOURS CANADIEN DE MATHÉMATIQUES DE NIVEAU SUPÉRIEUR

Partie A

1. Ce problème a été très bien réussi. On n'a trouvé aucune tendance dans les solutions incorrectes. La seule erreur commune a été de mal transcrire l'expression.
Moyenne: 4,9
2. Ce problème a été très bien réussi. Certains élèves ont utilisé $\frac{1}{3}$ pour représenter 30 % et d'autres ont calculé l'aire d'un triangle de façon erronée. La plupart des élèves ont suivi l'approche de la solution 1.
Moyenne: 4,7
3. Ce problème a été bien réussi. Certains ont procédé par tâtonnement pour ne trouver qu'une racine, soit $x = 0$ ou $x = 3$. D'autres ont divisé chaque membre par x , omettant ainsi la solution $x = 0$; par exemple, à partir de $x(x^3 - 3x^2 + x - 3) = 0$, ils ont conclu que $x^3 - 3x^2 + x - 3 = 0$.
Moyenne: 4,2
4. Réponses erronées fréquentes: 18, 24, 72, 96. On a accordé des points pour l'utilisation d'une méthode de dénombrement avec erreur de calcul ou d'une liste des possibilités et une réponse près de 36.
Moyenne: 3,1
5. Les élèves ont découvert une variété de régularités et de façons de les généraliser. Ces approches ont souvent mené à la bonne réponse, 10 944, ou à une réponse proche de celle-ci. À ceux et celles qui ont tenté d'additionner un à un les entiers sur la droite d'équation $y = -x$, on recommande de lire les solutions pour apprendre à le faire de façon algébrique. Cela a pour avantage de permettre d'additionner les nombres facilement, même s'il avait fallu le faire jusqu'à un nombre beaucoup plus grand que 1000.
Moyenne: 1,7
6. Ce problème était très difficile. Il fallait une bonne connaissance de géométrie euclidienne et de géométrie analytique pour le réussir. Il fallait aussi savoir comment joindre le centre du grand cercle aux trois points de contact des demi-cercles et du grand cercle.
Moyenne: 0,2

Partie B

1. Ce problème a été très bien réussi. Dans la partie (b), beaucoup d'élèves n'ont pas cherché à déterminer les valeurs de b et de c à partir des deux équations, ou ils ont commis des erreurs en le faisant. Dans la partie (c), certains élèves n'ont pas posé $y = 0$ dans l'équation $y = -\frac{2}{3}(d - 1)^2 + \frac{8}{3}$, ou ils n'ont pas restreint les valeurs de d à une valeur positive.
Moyenne: 8,6
2. De façon générale, les élèves qui ont tenté de résoudre ce problème ont réussi les parties (a) et (b). Dans la partie (b), la plupart des élèves ont présenté une solution à 3 tours. Beaucoup d'élèves n'ont pas tenté de résoudre la partie (c). Parmi ceux qui ont tenté de la résoudre, beaucoup ont réalisé qu'on ne pouvait pas gagner lorsque k est un nombre pair. Leur argumentation comprenait des idées intéressantes, mais manquait généralement de rigueur. Peu d'élèves ont poursuivi pour suggérer qu'on pouvait gagner lorsque k est un nombre impair ou pour présenter un algorithme clair qui démontrait que c'était possible.
Moyenne: 4,4
3. On a été agréablement surpris de voir un grand nombre d'élèves qui ont résolu la partie (a), ce qui exigeait une bonne compréhension de la composition de fonctions. Bon nombre d'élèves ont fait preuve de persévérance, dans la partie (b), pour démontrer qu'une telle fonction g n'existait pas. Comme il fallait s'y attendre, la partie (c) était très difficile. Des points ont été accordés pour avoir remarqué que la fonction h définie par $h(k) = k + 1$ satisfaisait aux propriétés données. Une lecture de nos solutions montre le défi de résoudre ce problème au complet en montrant qu'aucune autre fonction satisfait à ces propriétés.
Moyenne: 1,7

CONCOURS CANADIEN DE MATHÉMATIQUES DE NIVEAU INTERMÉDIAIRE

Partie A

1. Ce problème a été bien réussi. Quelques erreurs ont porté sur les angles égaux dans le triangle.
Moyenne: 4,7
2. La plupart des élèves ont réussi à générer une liste d'au moins 7 des 12 entiers. Quelques élèves n'ont pas réussi à choisir les deux entiers qu'il fallait additionner.
Moyenne: 3,9
3. Ce problème a été très bien réussi. On a surtout vu des erreurs de calcul plutôt que des erreurs conceptuelles.
Moyenne: 4,8
4. Ce problème a été assez bien réussi. Les erreurs les plus fréquentes ont porté sur une formule erronée pour l'aire d'un disque, un manque de minutie dans l'utilisation d'une approximation de π et la non-utilisation de l'aire des pépites de chocolat.
Moyenne: 3,9
5. Ce problème a été assez bien réussi. Bon nombre d'élèves ont oublié que a , b et c sont des entiers strictement positifs et ont répondu $b = 1$ (en prenant la plus petite valeur positive possible pour b) ou $b = \frac{31}{8}$ (en posant $a = 0$ et $c = 0$). Les élèves qui ont éprouvé de la difficulté ont surtout fait appel au tâtonnement sans penser à la divisibilité.
Moyenne: 2,6
6. Bon nombre d'élèves ne semblaient pas savoir comment aborder le problème. En particulier, beaucoup d'entre eux n'ont pas considéré la méthode indirecte. Beaucoup d'élèves ont procédé en traçant un nombre d'exemples. Quelques points ont été accordés lorsque ces exemples indiquaient une tentative de présenter ces exemples de manière organisée.
Moyenne: 0,4

Partie B

1. Ce problème a été bien réussi. Dans la partie (a), certains élèves ont utilisé les périmètres, alors qu'on devait compter les petits carrés. Dans la partie (d), l'erreur la plus fréquente a été de ne pas partir du périmètre pour déterminer le numéro de la figure.
Moyenne: 8,2
2. Dans la partie (a), la définition de factorielle n a été plutôt bien utilisée. Dans la partie (b), on demandait de générer une factorielle à partir d'une autre factorielle. On s'attendait à plus de succès. Dans la partie (c), beaucoup d'élèves ont obtenu une équation du second degré, mais n'ont pas éliminé la racine négative (-202). Dans la partie (d), plusieurs ont utilisé des exemples particuliers pour montrer que r est un carré parfait. Cela ne suffisait pas pour généraliser.
Moyenne: 5,0
3. Dans la partie (a), plusieurs ont donné tous les entiers équilibrés de la forme $3b8d5f$, mais on n'a accordé le maximum de points qu'à ceux qui ont justifié leur démarche. En particulier, il fallait justifier pourquoi b doit évaluer 5 seulement. Dans la partie (b), bon nombre d'élèves qui ont réalisé que b doit être égal à c ont ensuite présenté 499 comme un entier de trois chiffres pour lequel il existe exactement trois entiers équilibrés de la forme $4bcdef$. De fait, il y avait six entiers équilibrés de la forme $499def$, puisque def pouvait aussi être une permutation de 669. Certains ont avancé que puisque 5 et 7 étaient premiers, 455 et 477 étaient les *seuls* entiers de trois chiffres, sans réaliser que 488 est une autre possibilité. Puisque la question ne demandait qu'un seul entier, aucun point n'a été perdu pour cette erreur. La plupart des élèves qui ont tenté de répondre à la partie (c) ont obtenu quelques points. Les élèves ont éprouvé de la difficulté à justifier pourquoi les valeurs de k égales à 4, 5 ou 8 ne généraient aucun entier abc .
Moyenne: 1,3
