 Marcel te Bokkel, York Region District School Board, Newmarket, ON

The Centre for Education in Mathematics and Computing is pleased to announce the results of the 2020 Canadian Senior and Intermediate Mathematics Contests.

Our congratulations go to all who participated in this year's CSMC and CIMC. This year's Contests were resounding successes, with averages of 34.2 and 34.5, respectively.

As always, we would like to thank the hard-working Problems Committees. Many of the members of these Committees are active secondary school teachers who volunteer their time and contribute dozens of hours of expertise. Without their intriguing and sometimes amusing problems, these Contests would not be possible.

This year, especially, we would like to thank all of the educators and parents who arranged for their students to participate in these contests in the unusual and difficult circumstances of 2020. With the restrictions all around us, we know that this was not easy. We would also like to thank all participants for your interest in mathematics. We hope that the papers provided you with some interesting mathematics to think about and play with. Thank you for your support! Please continue to encourage your colleagues and fellow students to become involved in our activities.

Le Centre d'éducation en mathématiques et en informatique a d'annoncer les résultats du Concours canadiens de mathématiques de niveau supérieur et intermédiaire 2020.

Nos félicitations vont à tous les participants du CCMS et du CCMI de cette année. Les Concours de cette année retentissaient de succès, avec des moyennes de 34,2 et 34,5, respectivement.

Nous aimerions surtout remercier les Comités de problèmes pour leur dur travail. Plusieurs membres de ces Comités sont des enseignant(e)s d'école secondaire actifs qui offre leur temps et contribuent des douzaines d'heures d'expertise. Sans leurs problèmes perspicaces et amusants, ces Concours ne seraient pas possibles.

Cette année, nous tenons à remercier tout particulièrement les éducateurs, éducatrices et les parents qui ont organisé la participation de leurs élèves à ces concours dans les circonstances inhabituelles et difficiles de 2020. Nous savons que les restrictions actuelles n'ont pas facilité les choses. Nous aimerions également remercier tous les participants et participantes pour leur intérêt pour les mathématiques. Nous espérons que les concours vous ont offert des mathématiques intéressantes qui vous ont amusées et portées à réfléchir. Merci pour votre soutien continué!

CANADIAN SENIOR MATHEMATICS CONTEST

Part A

1. Very well done. A small number of students misinterpreted the problem or made a calculation error.
Average: 4.9
2. Well done. A common error among students who did not get the correct answer was assuming that the small rectangles were actually squares.
Average: 4.6
3. Well done. Some students gave the negative answer $a = -2$ corresponding to $(-2)^2 + (-1)^2 + 0^2 = 1^2 + 2^2$ (which is true, but not relevant since a is positive) along with the correct answer $a = 10$.
Average: 4.3
4. Students who understood the so-called “floor function” correctly realized that each term in the sum was equal to 3 or equal to 4. Most of these students got the correct answer, with a few students miscounting the numbers of 3s and 4s. Some students misunderstood this as a “rounding” function or one that could be split apart by assuming incorrectly $\lfloor a + b \rfloor$ is always equal to $\lfloor a \rfloor + \lfloor b \rfloor$.
Average: 2.9
5. Most attempts that involved squaring and adding the given equations led to a correct final answer. Errors using this approach were generally miscalculations. We did not see a large number of correct solutions that used a different approach. For example, isolating for x , y , or the sine or cosine of either of these values generally did not lead to a final answer. Similarly, the use of trigonometric identities other than $\sin^2 \theta + \cos^2 \theta = 1$ and the provided Useful Fact usually resulted in more complicated expressions rather than a path to the correct final answer of $\frac{1}{6}$.
Average: 1.5
6. It was good to see a considerable number of students correctly apply some or all of the three rules by substituting in values. We commonly saw solutions that correctly determined that $f(0) = 0$, $f(\frac{1}{2}) = \frac{1}{2}$ and $f(1) = 1$. The challenge in completing the problem was to then cleverly substitute the appropriate values into the second and third rules to determine the value $f(\frac{1}{7})$ and/or $f(\frac{6}{7})$. It was possible to plug in “unhelpful” values that lead down a long and unfruitful path.
Average: 0.8

Part B

1. This problem was well done overall. The most common issue through all parts was not fully answering the question (for example, giving only one of the coordinates of a point of intersection). In part (d), some students got to $x = \frac{2}{d}$ but did not list the values of d ; some students who did list these values of d did not verify that the y -coordinate was also an integer.
Average: 7.3
2. Part (a) was well done. Some students misremembered the formula for the area of a circle or used the wrong fraction of the area of the circle. In part (b), some students calculated the area of one piece of the shaded region but did not double this, while others had difficulty finding the areas of the triangles that needed to be subtracted from the sectors to obtain the correct answer. There were many different correct solutions presented to part (c) from using sectors and triangles as in (b) to rearranging the shaded pieces to be the differences in areas of circles and inscribed hexagons. Many students did not know where to start in (c) and some were careless in their calculations.
Average: 5.7

3. The majority of students who attempted part (a) were able to determine the solutions of both equations and then conclude that both $f(x)$ and $g(x)$ have distinct integer solutions. Use of only the discriminant was sufficient to show that solutions were distinct and real but more work was needed to correctly argue that the solutions were integers. Part (b) was generally done quite well for a problem appearing this late in the contest. We saw more correct arguments for the conditions in (iii) and (iv) than for those in (i) and (ii). One common error was trying to argue that if $a + b$ is a multiple of 3, then integers a and b must also be multiples of 3. (One of many counterexamples to this is $a = 4$ and $b = 5$.) Part (c) was very challenging and a full and proper solution needed to carefully use the statements to generate an infinite family of pairs, and also prove that this infinite family of pairs yields equations for which all of the conditions are true.

Average: 2.1

CANADIAN INTERMEDIATE MATHEMATICS CONTEST

Part A

1. Very well done. Most mistakes were minor errors in calculation.
Average: 4.8
2. Well done. Students generally had an idea of how to proceed. A common error was subtracting only one of the “overlapped squares”. Some students instead calculated the area of one portion of the region but did not double this to obtain the total area.
Average: 4.6
3. Well done. Most errors seemed to come from mis-reading the question.
Average: 4.1
4. Well done. Most errors came from students making incorrect assumptions about the nature or shape of the components of the figure. Very few students copied the diagram into the solution booklet, which made it very hard to give part marks to incorrect answers.
Average: 3.8
5. Many students found at least one pair satisfying the equation. However, many struggled to find all five solutions without including some pairs that were not solutions. Occasionally, incorrect pairs were given that included 0 as one of the coordinates.
Average: 1.7
6. This was a challenging problem. Many students gave an answer between 70 and 74, inclusive. A good number of students recognized that the answer could be no more than 74 players but did not realize that 72, 73 and 74 were not possible.
Average: 0.6

Part B

1. Parts (a) and (b) were very well done. Part (c) was well done; to receive full marks, students needed to consider all six possible arrangements or indicate why considering only the increasing versions was sufficient. In part (d), many students obtained the correct answers but did not provide sufficient justification of these answers. Others assumed, for example, that the common difference in the sequence needed to be an integer, which leads to an incorrect smallest possible value of $z - r$ of 20.
Average: 7.7
2. Many students had very good success in (a). In (a)(i), most mistakes were calculation errors. In (a)(ii), many students got the correct volume but then seemed to confuse volume with depth and gave the volume as their final answer, or gave the depth of the water that had been removed instead of depth of the remaining water. Part (a)(iii) was trickier; some students did not understand the question and others gave the length of time rather than the depth of water. Part (b) was intended to be challenging. Many students correctly calculate the time but were not able to proceed any further. A key in this part was to look for and recognize the “similarity” in three-dimensional shapes.
Average: 5.1

- In (a), many students correctly gave values for a , b , c , and d which resulted in P being a multiple of 216, as required. In contrast, in (b), some students gave a prime factorization of 2000 but then failed to argue clearly why you could not combine these factors in such a way to determine values for a , b , c , and d . We note that in (a) an example was sufficient to show that it is possible, but to show impossibility in (b), a careful argument was needed. In (c), a good number of students recognized that P must include 7, 8, or 9 factors of 2, but when considering cases they ignored the overlap between their cases. Some students attempted a brute force method without much explanation as to why some combinations were permitted or not permitted. Part (d) was similar to part (c), in that many students took a brute force approach without carefully justifying how they were eliminating certain candidates as valid P values.

Average: 2.1

CONCOURS CANADIEN DE MATHÉMATIQUES DE NIVEAU SUPÉRIEUR

Partie A

- Très bien réussi. Un petit nombre d'élèves ont mal interprété le problème ou ont fait une erreur de calcul.
Moyenne: 4,9
- Bien réussi. Parmi les réponses fautives, une erreur commune était de supposer que les petits rectangles étaient en fait des carrés.
Moyenne: 4,6
- Bien réussi. Quelques élèves ont donné la réponse négative $a = -2$ correspondant à $(-2)^2 + (-1)^2 + 0^2 = 1^2 + 2^2$ (bien que celle-ci soit vraie, cette réponse n'est pas pertinente car a est positif) ainsi que la bonne réponse $a = 10$.
Moyenne: 4,3
- Les élèves ayant saisi la notion de la « partie entière inférieure » ont donc compris que chaque terme de la somme était égal à 3 ou à 4. La plupart de ces élèves ont obtenu la bonne réponse, quelques élèves ayant mal compté les nombres de 3 et de 4. Certains étudiants ont appliqué à tort la notion de « l'arrondi entier » ou ont supposé à tort que $\lfloor a + b \rfloor$ est toujours égal à $\lfloor a \rfloor + \lfloor b \rfloor$.
Moyenne: 2,9
- La plupart des solutions dans lesquelles l'élève élevait les équations au carré et les additionnait ont mené à une réponse finale correcte. Les erreurs commises en utilisant cette approche étaient généralement des erreurs de calcul. Il n'y avait pas un grand nombre de solutions correctes utilisant une approche différente. Par exemple, le fait d'isoler x , y ou le sinus ou le cosinus de l'une ou l'autre de ces valeurs ne menait généralement pas à une réponse finale. De même, l'utilisation d'identités trigonométriques autres que $\sin^2 \theta + \cos^2 \theta = 1$ et celle fournie dans le renseignement utile aboutissait généralement à des expressions plus compliquées plutôt qu'à un chemin vers la bonne réponse finale de $\frac{1}{6}$.
Moyenne: 1,5
- Il était encourageant de constater qu'un bon nombre d'élèves ont bien appliqué certaines des conditions (sinon toutes les trois) en y substituant des valeurs. On a souvent vu des solutions qui ont bien déterminé que $f(0) = 0$, que $f(\frac{1}{2}) = \frac{1}{2}$ et que $f(1) = 1$. Or, pour bien résoudre le problème, le défi était ensuite de substituer astucieusement les valeurs appropriées dans les deuxième et troisième conditions pour déterminer la valeur de $f(\frac{1}{7})$ et/ou de $f(\frac{6}{7})$. Il était possible de substituer des valeurs dites « inutiles » qui pouvaient mener sur un long chemin infructueux.
Moyenne: 0,8

Partie B

- En général, ce problème a été bien réussi. Cependant, le problème le plus commun dans toutes les parties était de ne pas répondre complètement à la question (par exemple, ne donner qu'une seule des coordonnées d'un point d'intersection). Dans la partie (d), certains élèves sont arrivés à $x = \frac{2}{d}$ mais n'ont pas énuméré les valeurs de d ; parmi les élèves qui ont énuméré les valeurs de d , certains n'ont pas vérifié que l'ordonnée était également un entier.
Moyenne: 7,3
- La partie (a) était bien réussie. Quelques élèves se sont mal souvenus de la formule de l'aire d'un cercle ou ont utilisé la mauvaise fraction de l'aire du cercle. Dans la partie (b), certains élèves ont calculé l'aire de l'une des parties de la région ombrée et ont négligé de la doubler, tandis que d'autres ont eu de la difficulté à déterminer les aires des triangles qu'il fallait soustraire des secteurs pour obtenir la bonne réponse. Il y avait de nombreuses solutions correctes différentes présentées à la partie (c). Certaines telles solutions utilisaient des secteurs et des triangles comme dans la partie (b) pour arriver à la bonne réponse tandis que d'autres

réorganisaient les parties ombrées de manière qu'elles correspondent à des différences dans les aires de cercles et d'hexagones inscrits. Plusieurs élèves ne savaient pas par où commencer dans la partie (c) tandis que d'autres étaient négligents dans leurs calculs.

Moyenne: 5,7

3. La grande majorité des élèves qui ont tenté la partie (a) ont pu déterminer les solutions aux deux équations et ont pu conclure que $f(x)$ et $g(x)$ ont tous les deux des solutions entières distinctes. On pouvait montrer que les solutions étaient distinctes et réelles en utilisant uniquement le discriminant. Or, il fallait plus d'étapes pour démontrer que les solutions étaient des entiers. Pour un problème qui paraît aussi tard dans le concours, la partie (b) était en général très bien réussie. Il y avait plus d'arguments corrects pour les conditions de (iii) et (iv) que pour celles de (i) et (ii). Une erreur commune était de supposer que si $a + b$ est un multiple de 3, alors les entiers a et b doivent également être des multiples de 3. (Parmi les nombreux contre-exemples à cela, on a par exemple $a = 4$ et $b = 5$.) La partie (c) posait un véritable défi. Afin qu'elle soit considérée comme étant complète, une solution devait utiliser soigneusement les énoncés pour générer un ensemble infini de couples et devait démontrer que l'on peut obtenir des équations à partir de cet ensemble qui remplissent toutes les conditions.

Moyenne: 2,1

CONCOURS CANADIEN DE MATHÉMATIQUES DE NIVEAU INTERMÉDIAIRE

Partie A

1. Très bien réussi. La plupart des erreurs étaient de petites erreurs de calcul.
Moyenne: 4,8
2. Bien réussi. En général, les élèves savaient comment procéder. Une erreur commune consistait à soustraire un seul des « carrés superposés ». D'autres élèves ont plutôt calculé l'aire de l'une des deux parties de la région ombrée mais n'ont pas doublé cette aire pour obtenir l'aire totale de la région ombrée.
Moyenne: 4,6
3. Bien réussi. La plupart des erreurs semblent provenir d'une mauvaise lecture de la question.
Moyenne: 4,1
4. Bien réussi. La plupart des erreurs provenaient de suppositions erronées que faisaient les élèves quant à la nature ou à la forme des composantes de la figure. Très peu d'élèves ont recopié la figure dans leur livret de solutions. Par conséquent, il était très difficile d'attribuer des notes partielles aux mauvaises réponses.
Moyenne: 3,8
5. De nombreux élèves ont trouvé au moins un couple d'entiers qui vérifient l'équation. Cependant, plusieurs ont eu du mal à trouver les cinq solutions qui vérifient l'équation (certains ont même inclus des couples d'entiers qui ne vérifient pas l'équation). Parfois, des couples incorrects, dont l'un des entiers est 0, ont été proposés comme solutions.
Moyenne: 1,7
6. Ce problème a posé un véritable défi. Plusieurs élèves ont donné des réponses allant de 70 à 74. Un bon nombre d'élèves ont bien constaté que la réponse ne pouvait pas être plus de 74 joueurs mais n'ont pas constaté que 72, 73 et 74 n'étaient pas possibles.
Moyenne: 0,6

Partie B

1. Les parties (a) et (b) étaient très bien réussies. La partie (c) était bien réussie; pour obtenir tous les points, les élèves devaient examiner les six arrangements possibles ou indiquer pourquoi il suffisait de ne considérer que les versions croissantes. Dans la partie (d), de nombreux élèves ont obtenu les bonnes réponses mais n'ont pas assez bien justifié ces réponses. D'autres ont supposé, par exemple, que la raison de la suite devait être un entier. Cette supposition a mené à une plus petite valeur possible de $z - r$ de 20 (ce qui est une valeur erronée).
Moyenne: 7,7
2. Plusieurs élèves ont bien réussi la partie (a). Dans la partie (a)(i), la plupart des erreurs étaient des erreurs de calcul. Dans la partie (a)(ii), de nombreux élèves ont obtenu le bon volume mais semblent avoir confondu volume et profondeur et ont donné comme réponse finale le volume. D'autres élèves ont donné comme réponse finale la profondeur de l'eau qui s'était écoulée du réservoir plutôt que la profondeur de l'eau restante dans le réservoir. Le problème de la partie (a)(iii) était encore plus épineux; quelques élèves n'ont pas compris la question tandis que d'autres, au lieu de donner la profondeur comme réponse, ont plutôt donné la durée de temps nécessaire pour que les profondeurs de l'eau dans les deux réservoirs soient égales. La partie (b) était censée poser un défi. Plusieurs élèves ont bien calculé la durée de temps mais n'ont pas pu avancer plus loin dans la résolution du problème. L'élément clé dans cette partie était de rechercher et de pouvoir identifier les « similitudes » entre les formes tridimensionnelles.
Moyenne: 5,1
3. Dans la partie (a), de nombreux élèves ont donné des valeurs de a , b , c et d telles que P soit un multiple de 216. En revanche, dans la partie (b), quelques élèves ont présenté la factorisation première de 2000 mais n'ont

pas su expliquer clairement pourquoi on ne pouvait combiner ces facteurs de manière à déterminer des valeurs de a , b , c et d . Remarquons qu'il ne fallait qu'un simple exemple pour la partie (a) pour démontrer que cela était possible. Or, il fallait un argument précis et concis dans la partie (b) pour démontrer l'impossibilité. Dans la partie (c), un bon nombre d'élèves ont bien constaté que P devait inclure 7, 8 ou 9 facteurs de 2. Or, en examinant leurs cas, ils ont ignoré le chevauchement entre ces derniers. Quelques élèves ont tenté une méthode de « force brute » sans donner d'explications sur les raisons pour lesquelles certaines combinaisons étaient autorisées ou non. La partie (d) était similaire à la partie (c); plusieurs élèves ont adopté une approche par « force brute », sans clairement justifier les raisons pour lesquelles ils arrivaient à affirmer que certaines valeurs ne pouvaient être des valeurs possibles de P .
