The Centre for Education in Mathematics and Computing is pleased to announce the results of the 2022 Canadian Senior and Intermediate Mathematics Contests.

Our congratulations go to all who participated in this year's CSMC and CIMC. The averages on the CSMC and CIMC were 28.5 and 30.1, respectively.

As always, we would like to thank the hard-working Problems Committees. Many of the members of these Committees are active secondary school teachers who volunteer their time and contribute dozens of hours of expertise. Without their intriguing and sometimes amusing problems, these Contests would not be possible.

As always, we would like to thank all of the educators who arranged for their students to participate in these contests. We would also like to thank all participants for your interest in mathematics. We hope that the papers provided you with some interesting mathematics to think about and play with. Thank you for your support! Please continue to encourage your colleagues and fellow students to become involved in our activities.

Le Centre d'éducation en mathématiques et en informatique a d'annoncer les résultats du Concours canadiens de mathématiques de niveau supérieur et intermédiaire 2022.

Nos félicitations vont à tous les participants du CCMS et du CCMI de cette année. Les moyennes sur le CSMC et le CIMC étaient de 28,5 et 30,1, respectivement.

Nous aimerions surtout remercier les Comités de problèmes pour leur dur travail. Plusieurs membres de ces Comités sont des enseignant(e)s d'école secondaire actifs qui offre leur temps et contribuent des douzaines d'heures d'expertise. Sans leurs problèmes perspicaces et amusants, ces Concours ne seraient pas possibles.

Comme toujours, nous tenons à remercier tout particulièrement les éducateurs et les éducatrices qui ont organisé la participation de leurs élèves à ces concours. Nous aimerions également remercier tous les participants et participantes pour leur intérêt pour les mathématiques. Nous espérons que les concours vous ont offert des mathématiques intéressantes qui vous ont amusées et portées à réfléchir. Merci pour votre soutien continué!

CANADIAN SENIOR MATHEMATICS CONTEST

Part A

1. Very well done. Some students calculated  $s$  as 5, instead of 2.  
Average: 4.8
2. Very well done. Some students determined the value of  $x^2 + y^2$  instead of  $x^2 - y^2$ , and others had minor errors when solving equations..  
Average: 4.7
3. Well done. A common error was to misunderstand the meaning of “least common multiple” and instead look for two numbers whose product is 273. This gives a quadratic equation which does not have integer roots..  
Average: 3.9
4. Well done. Few participants used the double angle formula that was given as a Useful Fact and instead obtained an approximate answer using a variety of techniques. Some students made errors with trigonometric ratios, while others misread which angle was double another.  
Average: 3.6
5. This was a difficult problem that had many correct approaches. Most students who successfully solved this problem either used repeated applications of the Pythagorean Theorem, or used similar triangles along with the Pythagorean Theorem. We also saw a few solutions that used the circle properties. Most students who attempted this problem received at least two marks for applying the Pythagorean Theorem correctly or similar triangles correctly, both of which also required a construction. To earn further marks, students needed to use two facts and make significant progress to getting an equation in one variable.  
Average: 0.5
6. As in many probability questions, the challenge with this problem was to count carefully when determining the numerator and denominator for the probability expression. We were pleased when seeing  $\frac{15!}{3!5!7!}$  which is the total number of different ways in which the marbles could be removed. It was more difficult to count the number of ways for which the colour of the last marble removed would be red. One important final step when solving a problem is to verify that the answer is reasonable. For this problem, one useful observation is that the final probability must be greater than  $\frac{1}{3}$ . This is because given the number of marbles of each colour, we can see that we are more likely to run out of red marbles before we run out of blue marbles or green marbles.  
Average: 0.1

Part B

1. Part (a) was well done, although some students solved an equation but did not read the question well and so did not provide the required coordinates. Part (b) was also well done by most, but some struggled with finding the lengths of either of the bases or the height of the trapezoid. In part (c), the key was identifying a way to determine the area. Those who saw how to split the shaded region into two triangles or to view it as the difference between two areas then made reasonable progress towards the final answer.  
Average: 7.6
2. Part (a) was well done. The split between those who factored and those who used the quadratic formula seemed to be close to even. For those who solved this incorrectly, it was often due to incorrectly using the quadratic formula, or by incorrectly saying that  $\sqrt{a^2 + a} = a + a$ , so then  $2a = \frac{2}{3}$ . In part (b), a common mistake was to not address the “closest” part or include a discussion of why they only considered  $(m + 1)^2$  as the closest perfect square and did not consider how close the expression is to  $m^2$ . Some students did this part by testing out a few values of  $m$  and seeing a pattern. Without further explanation as to why this pattern continues, solutions like this received just 1 mark. Part (c) was challenging and was not attempted by many.  
Average: 2.9

## Comments on the Contests

---

3. The final problem on the CSMC is always a very difficult problem and this year's B3 was no exception. Despite this, we saw a good number of correct answers or solid attempts at part (a). To earn part marks, we required a method of counting or listing quadruples which was organized and systematic. Parts (b) and (c) required a lot of care and precise justification. It was possible to solve part (b) directly or to first come up with a general formula and then use it to solve both parts (b) and (c).

Average: 0.4

CANADIAN INTERMEDIATE MATHEMATICS CONTEST

Part A

1. Very well done. Common errors included calculating the surface area rather than the volume and incorrectly calculating the length of the edges of the cube.  
Average: 4.6
2. Very well done. Some students determined the measure of  $\angle BAD$ , but did not finish the problem by calculating the measure of  $\angle BAC$ , while other students assumed that the equal angles in  $\triangle BAD$  were the same as those in  $\triangle DAC$ .  
Average: 4.1
3. Very well done. The most common mistake was forgetting to add  $72 + 54$  to get the total number of problems solved by Kaeli.  
Average: 4.6
4. Those who were successful with this problem more often took an approach along the lines of Solution 2, assigning a value to one of the variables and working out what the rest must be. Most who were not successful with this question did at most some manipulation with the fractions, to solve for at least one of the variables in terms of the other, but then often did not get much further.  
Average: 2.8
5. Most students struggled to find a systematic approach to solve this problem. As a result it was rare to give part marks for incorrect answers. The incorrect answer of 23 was very common.  
Average: 1.6
6. Like many counting problems, finding a path through this problem required translating the text into a mathematical approach, then finding a way of breaking the counting into suitable cases, and then finally working very carefully through the various situations. Most students who attempted this problem correctly identified that the product required two factors of 2 and a factor of 3. Those students who then considered cases in which the product included 8 and didn't include 8, and/or included 30 and didn't include 30, had the most success.  
Average: 0.4

Part B

1. Many students had good success on this problem. Throughout, the most common error in this question was forgetting that the same integer cannot appear in the grid twice; this led to many students failing to eliminate candidates from the lists of values for  $a$  and  $k$ , respectively, in parts (c) and (d). Another common error, for those who remembered the non-repeating condition on the integers, was to include  $a = 6$  as a possibility in part (c), forgetting that this would mean both  $b$  and  $c$  would be equal to 10.  
Average: 6.5
2. Part (a) was usually well done. The most common errors were arithmetic mistakes. In part (b), some students attempted to solve this problem by trial and error and made the assumption that  $x$  and  $y$  were integers. While this led to a correct answer it was not well justified. Many students did not attempt part (c). Some students correctly reasoned that one could calculate the area of the quadrilateral as a difference of the areas of two triangles. They then struggled to find an equation for this area and if they found an equation, they struggled find integer values that satisfied the equation and the given constraints.  
Average: 4.0

## Comments on the Contests

---

3. Part (a) was well done. In part (b)(i), many students correctly determined that  $0 \leq h - b \leq 16$ , but then counting the number of ordered pairs  $(h, b)$  for which this inequality is true was a challenge. In part (b)(ii), some students were able to use their reasoning from (i) to determine that  $0 \leq h - b \leq \frac{120}{x} - 8$  but then struggled to determine and solve the resulting quadratic.

Average: 1.5
